

Introduction to C++

A Basic Program

01/15/2009

Kill Leftover VNC Sessions

Connect to `comphy.fsu.edu:#`:

(“#” is your vnc port number)

- Check your `vncserver(s)`
 - If a `vncserver` is up and running there should be a file called `~/ .vnc/comphy.fsu.edu:#.pid`
- On `comphy`, run the command
“`ps -aux | grep vnc`”
and look for your user name
(or type “`ps aux | grep vnc | grep <username>`”)

Outline

- 1 Homework Assignment
- 2 Fundamental Concepts
rvalues and lvalues
- 3 Programming Standards
- 4 Today's Exercise

Homework Assignment

① Hopefully, you have read Chapter 3 & 4 !!

- *Introduction to Computer and Software Architecture*
- *Fundamental C++ Concepts*

② Assignments of Chapters 3 & 4

- See [handout!](#)
- Due Tuesday, January 20
→ Hand in a paper copy

Outline

- 1 Homework Assignment
- 2 Fundamental Concepts**
rvalues and lvalues
- 3 Programming Standards
- 4 Today's Exercise

Tokens, Names, and Keywords

```
# include <iostream.h>
```

```
main() {  
    int var = 4;  
  
    var = var + 1;  
    cout << endl << var;  
}
```

- 1 A program is read as a sequence of characters called **tokens**:
a-z, A-Z, 0-9, and punctuation characters.
- 2 A **word** or **name** is a sequence of tokens terminated by *whitespace*.
- 3 A **reserved keyword** is a word, such as **int** or **cout**, for which the compiler has a special interpretation.

Expressions and Statements

```
# include <iostream.h>
```

```
main() {  
    int var = 4;  
  
    var = var + 1;  
    cout << endl << var;  
}
```

- 1 A segment of code in C++ that is terminated by a semicolon is called a **statement**.
- 2 **Preprocessor directives** begin with a # sign and are not terminated by a semicolon.
- 3 A statement is composed of one or more valid **expressions** separated by **operators** (+, -, *, /, <<):
 - 13; is valid statement
 - a = b + 3; “expression”

Declarations and Definitions

A declaration tells the compiler about the properties of a name. A definition, in addition, specifies the value to be associated with a name, or in the case of a variable definition, specifies that storage should be allocated.

```
# include <iostream.h>
```

```
main() {
```

```
    int var = 4;   This is a definition and includes a declaration.
```

```
    var = var + 1;
```

```
    cout << endl << var;
```

```
}
```

Declarations and Definitions

A declaration tells the compiler about the properties of a name. A definition, in addition, specifies the value to be associated with a name, or in the case of a variable definition, specifies that storage should be allocated.

```
# include <iostream.h>
```

```
main() {
```

```
    int var = 4;
```

```
    int var = 4;  Compiler error, "var" can only be defined once!
```

```
    var = var + 1;
```

```
    cout << endl << var;
```

```
}
```

Declarations and Definitions

A declaration tells the compiler about the properties of a name. A definition, in addition, specifies the value to be associated with a name, or in the case of a variable definition, specifies that storage should be allocated.

```
# include <iostream.h>
```

```
extern int var;  But var can be declared more often!
```

```
program() {
```

```
}
```

Declarations and Definitions

A declaration tells the compiler about the properties of a name. A definition, in addition, specifies the value to be associated with a name, or in the case of a variable definition, specifies that storage should be allocated.

```
# include <iostream.h>
```

```
main() {
```

```
    int var = 4;
```

```
    var = 10;  Not a definition, does not allocate new memory.
```

```
    var = var + 1;
```

```
    cout << endl << var;
```

```
}
```

rvalues and lvalues

The term *rvalue* refers to a data value that is stored at some address in memory. An *rvalue* is an expression that cannot have a value assigned to it. Both a literal constant and a variable can serve as an *rvalue*. When an *lvalue* appears in a context that requires an *rvalue*, the *lvalue* is implicitly converted to an *rvalue*.

```
# include <iostream.h>
```

```
main() {
```

```
    int var = 4;
```

```
    var = var + 1;
```

```
    cout << endl << var;
```

```
}
```

Outline

- 1 Homework Assignment
- 2 Fundamental Concepts
rvalues and lvalues
- 3 Programming Standards
- 4 Today's Exercise

Formatting Conventions and Comments

Comments: `/* ... */` or `//`

```
// What does this program do?
```

```
// Author:
```

```
// Creation Date:
```

```
# include <iostream.h>
```

```
main() {
```

```
    int var = 4;
```

```
    var = var + 1;
```

```
    cout << endl << var;
```

```
}
```

- 1 Prolog
- 2 Section explanation
- 3 Interpretation of significant code

Formatting Conventions and Comments

Comments: `/* ... */` or `//`

4.10 Conventions (“The 10 Formatting Commandments”):

- Descriptive variable or function names: `numberOfGridPoints`
- Spaces to the right and left of binary operators: `i = j + -10`
- ...
- Blank lines should be used between different program units.
- Function arguments should begin with a small `a`.
- ...
- All letters of global constants should be capitalized.

- 1 Homework Assignment
- 2 Fundamental Concepts
rvalues and lvalues
- 3 Programming Standards
- 4 Today's Exercise

Programming Standards & Simple Data Plots

Sierpinski's Carpet

Programming Standards & Simple Data Plots

Sierpinski's Carpet

- 1 Select a starting point in the triangle
- 2 Randomly choose a vertex
- 3 Make new point halfway to vertex
- 4 Repeat from “2”

Program Building & Running

Programming and Compiling

```
[<user>@comphy ~]$ emacs sierpinski.cc &
```

```
[<user>@comphy ~]$ g++ -Wall -pedantic sierpinski.cc -o sierpinski
```

Executing Program

```
[<user>@comphy ~]$ sierpinski
```

```
0.5 0
```

```
0.25 0
```

```
0.125 0
```

```
...
```

```
[<user>@comphy ~]$ sierpinski > sierpinski.dat
```

Plotting with Gnuplot

```
[<user>@comphy ~]$ gnuplot
```

```
gnuplot> plot "sierpin.dat" with points ps 0.1
```

Saving graph output in gnuplot

```
gnuplot> set output "sierpin.pbm"
```

```
gnuplot> set terminal pbm color
```

```
gnuplot> plot "sierpin.dat" with points ps 0.1
```

```
gnuplot> set terminal x11
```

```
gnuplot> quit
```
