# Non-Perturbative QCD

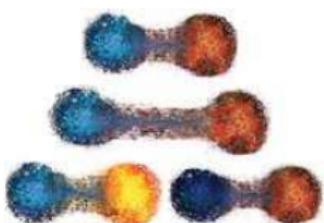

QCD is the theory of the strong nuclear force which describes the interactions of quarks and gluons making up hadrons.

Strong processes at larger distances and at small (soft) momentum transfers belong to the realm of non-perturbative QCD.

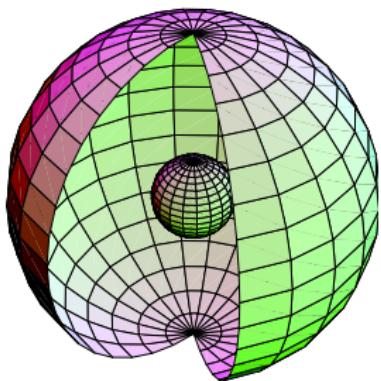

Quarks are confined within hadrons.

Confinement of quarks and gluons within nucleons is a non-perturbative phenomenon, and QCD is extremely hard to solve in non-perturbative regimes: Knowledge of internal structure of nucleons is still limited.

This is particularly true for excited nucleons.

# Non-Perturbative QCD

How does QCD give rise to excited hadrons?

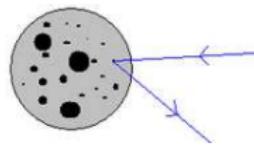

Interaction between quarks fairly unknown throughout > 98 % of a hadron's volume.

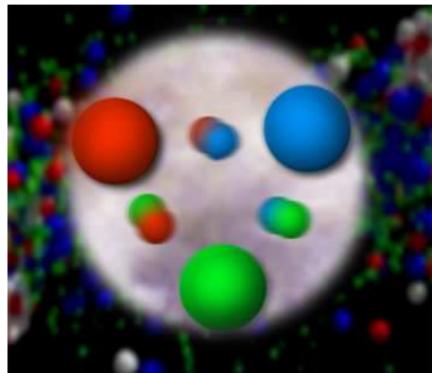

**Terra incognita**

Explaining the excitation spectrum of hadrons is central to our understanding of QCD in the low-energy regime (Hadron Models, Lattice QCD, etc.)

- Complementary to Deep Inelastic Scattering (DIS) where information on collective degrees of freedom is lost.

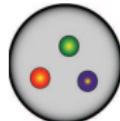

# Non-Perturbative QCD

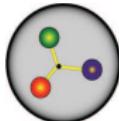

How does QCD give rise to excited hadrons?

- ① What is the origin of confinement?
- ② How are confinement and chiral symmetry breaking connected?
- ③ Would the answers to these questions explain the origin of  $\sim 98\%$  of observed matter in the universe?

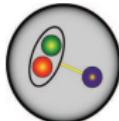

**Excited Baryons:** What are the fundamental degrees of freedom inside a proton or a neutron? How do they change with varying quark masses?

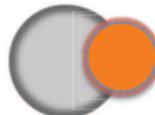

CQM

CQM+flux tubes

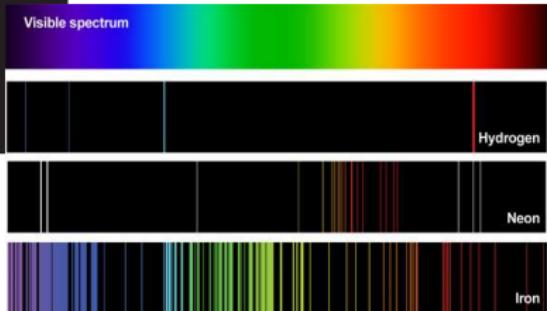

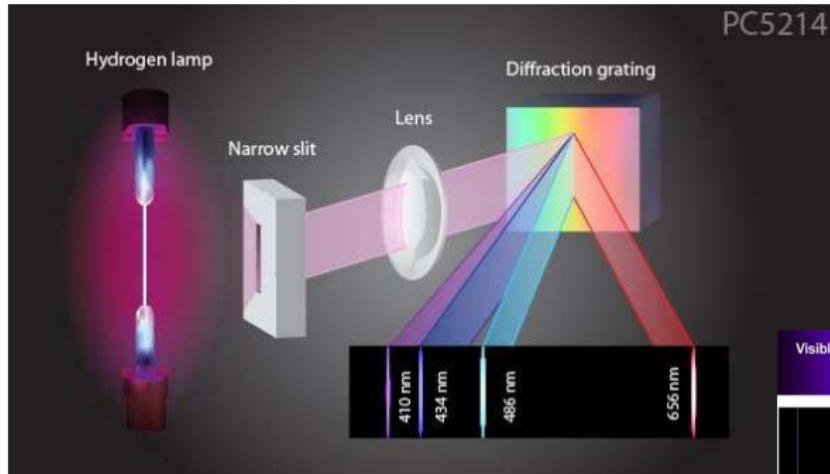

Quark-diquark clustering

Nucleon-meson system

# Understanding Excited Baryons

The excitation spectrum of the hydrogen atom:

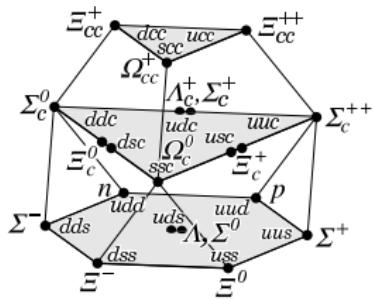

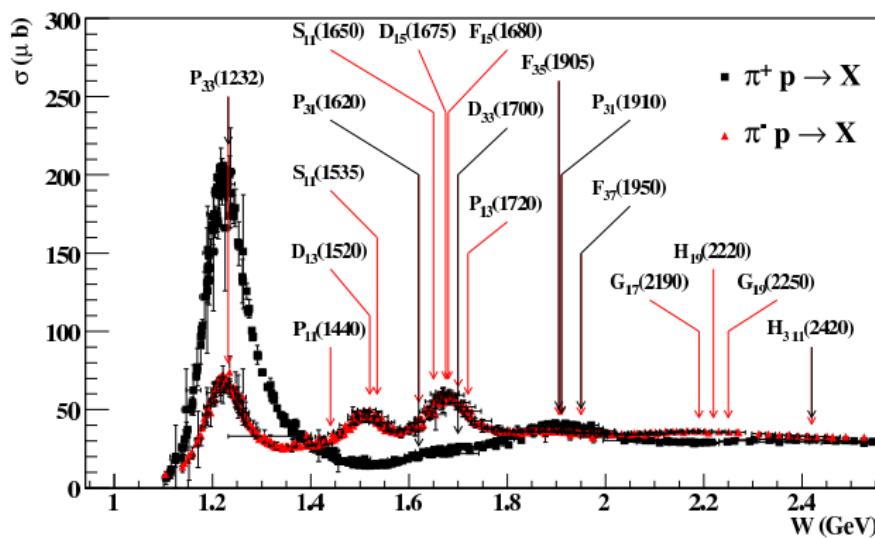

Study of the hydrogen spectrum has shown that the understanding of the structure of a bound state and of its excitation spectrum go hand in hand.

# Understanding Excited Baryons

$\Delta(1232)\frac{3}{2}^+$  (new)

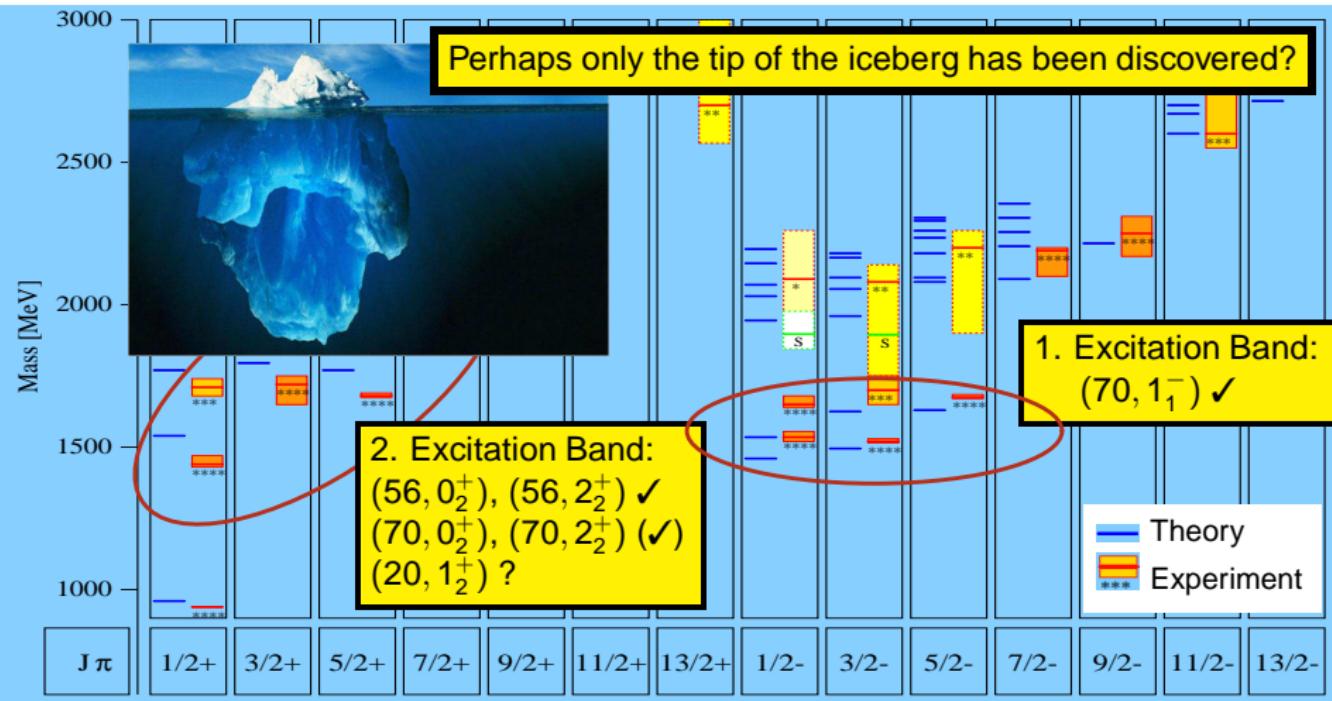

## Spectrum of Nucleon Resonances

— S. Capstick and N. Isgur, Phys. Rev. D34 (1986) 2809

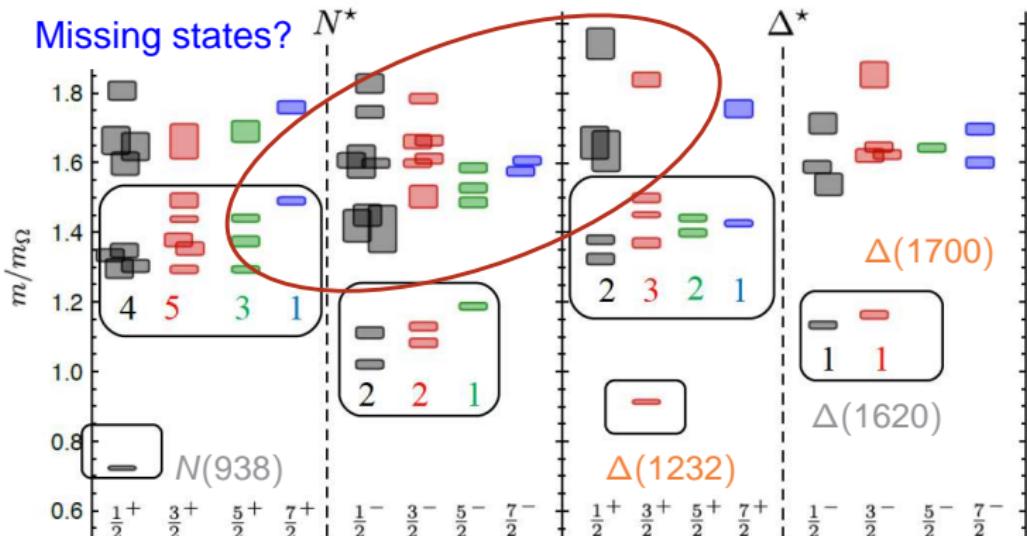

# Spectrum of Nucleon Resonances

— S. Capstick and N. Isgur, Phys. Rev. D34 (1986) 2809

# Excited-State Baryon Spectroscopy from Lattice QCD

R. Edwards *et al.*, Phys. Rev. D **84**, 074508 (2011)

$m_\pi = 400 \text{ MeV}$

Exhibits broad features expected of  $SU(6) \otimes O(3)$  symmetry

→ Counting of levels consistent with non-rel. quark model, no parity doubling

# Components of the Experimental $N^*$ Program

The excited baryon program has two main components:

- **Probe resonance transitions at different distance scales**

Electron beams are ideal to measure resonance form factors and their corresponding  $Q^2$  dependence.

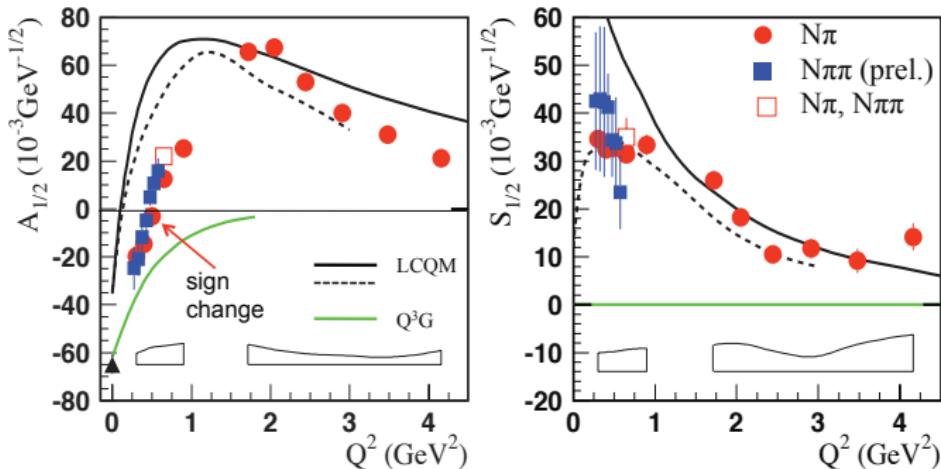

→ Provides information on the structure of excited nucleons and on the confining (effective) forces of the 3-quark system.

- **Establish the systematics of the spectrum**

Current medium-energy experiments use photon beams to map out the baryon spectrum (JLab, ELSA, MAMI, SPring-8, etc.).

→ Provides information on the nature of the effective degrees of freedom in strong QCD and also addresses the issue of previously unobserved or so-called *missing resonances*.

# Helicity Amplitudes for the “Roper” Resonance

Data from CLAS

$A_{1/2}$  and  $S_{1/2}$  amplitudes:  
 e.g. I. Aznauryan *et al.*,  
 PRC **78**, 045209 (2008);  
 PRC **80**, 055203 (2009).

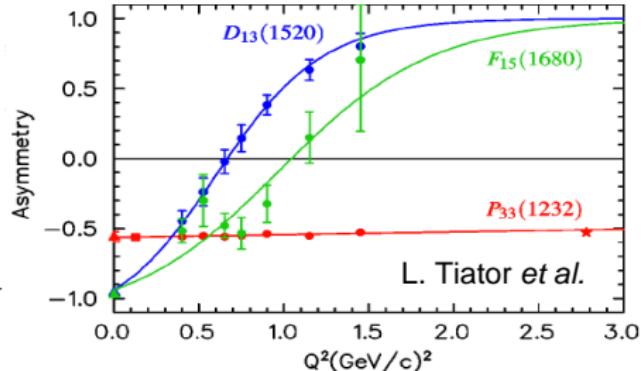

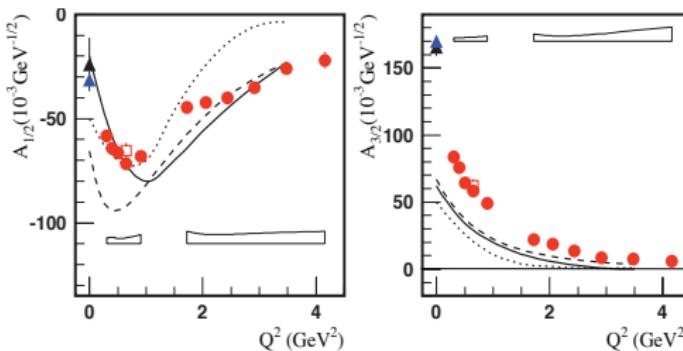

Quark-model calculations:

—  $q^3 G$  hybrid state  
 - - -  $q^3$  radial excitation

Consistency between both channels ( $N\pi\pi$ ,  $N\pi$ ): sign change, magnitude, ...

- At short distances (high  $Q^2$ ), Roper behaves like radial excitation.
- Low  $Q^2$  behavior not well described by LF quark models:  
 e.g. meson-baryon interactions missing
- Gluonic excitation likely ruled out!

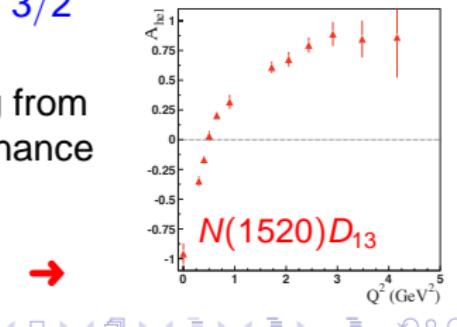

# Helicity Amplitudes for $\gamma^* p \rightarrow N(1520)D_{13}$ Transition

There is clear evidence for helicity switch from  $\lambda = 3/2$  (at photon point) to  $\lambda = 1/2$  at high  $Q^2$ :

- Rapid change in helicity structure when going from photo- to electroproduction of a nucleon resonance  
 → Stringent prediction of the CQM!

$$\mathcal{A}_{\text{hel}} = \frac{|A_{1/2}|^2 - |A_{3/2}|^2}{|A_{1/2}|^2 + |A_{3/2}|^2}$$

# Experimental Facilities

## CBELSA/TAPS at ELSA

## Meson photoproduction:

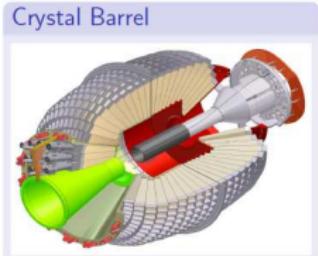

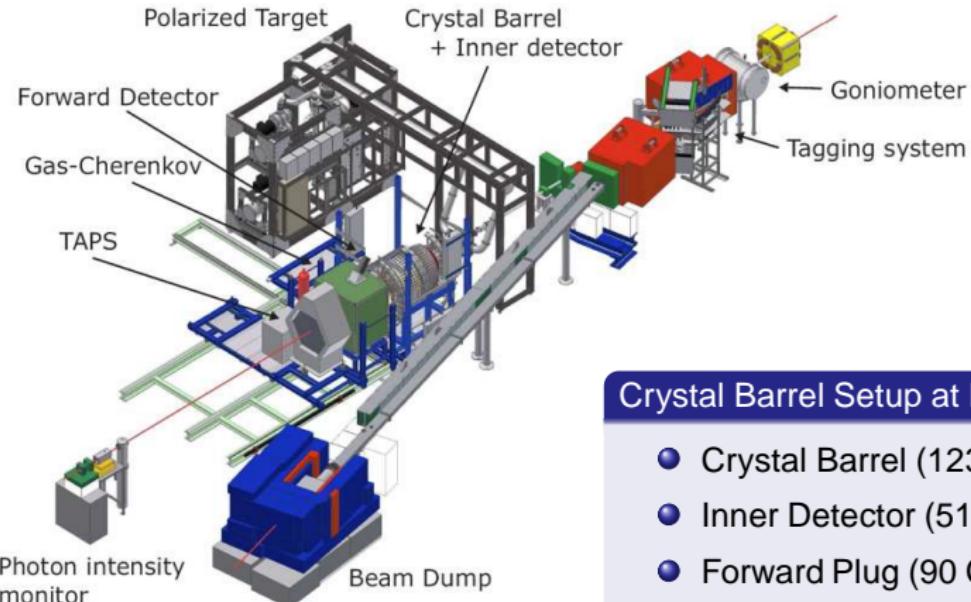

- $\gamma p \rightarrow p \pi^0 \rightarrow p \gamma\gamma$
- $\gamma p \rightarrow p \eta \rightarrow p \gamma\gamma, p 3\pi^0, p \pi^+ \pi^- \pi^0$
- $\gamma p \rightarrow p \omega \rightarrow p \pi^0 \gamma, \pi^+ \pi^- \pi^0$

## Jefferson Laboratory

# Double-Polarization: Toward Complete Experiments

Calorimeter system at ELSA is optimized for neutral particles.

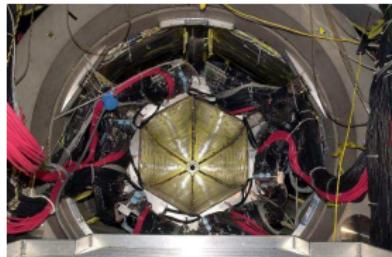

Close to  $4\pi$  coverage

## Crystal Barrel Setup at ELSA

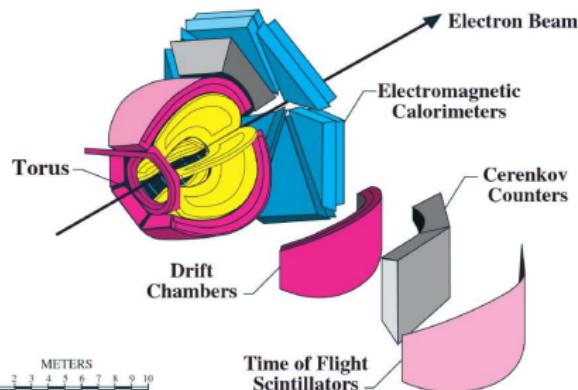

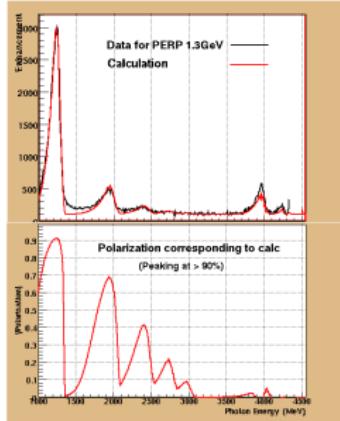

- Crystal Barrel (1230 CsI crystals)
- Inner Detector (513 scintillating fibers)
- Forward Plug (90 CsI crystals with PM's)
- MiniTAPS (216 BaF<sub>2</sub>, 1° - 12°)

Frozen-Spin Target: Butanol (C<sub>4</sub>H<sub>9</sub>OH).

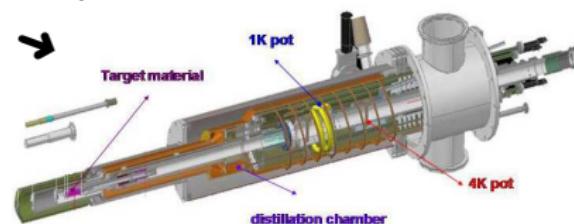

# The CLAS Spectrometer at Jefferson Laboratory

g8b  
linear beam polarization

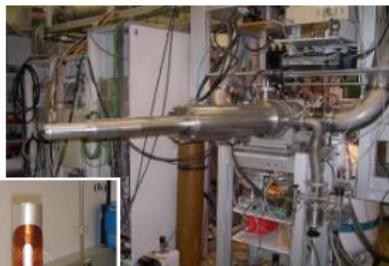

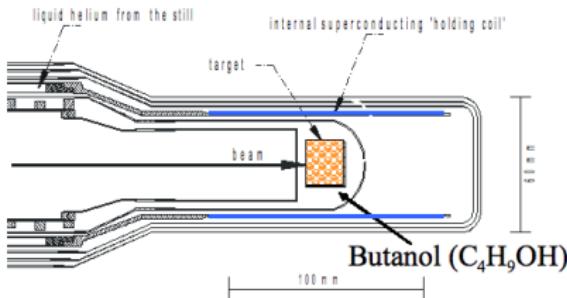

FROST  
double polarization

# Double-Polarization: Frozen Spin Targets

Horizontal cryostat with integrated solenoid to freeze the proton spin.

- DNP at high B-field (2.5 T), holding mode at 0.4 T
- Relaxation time at ELSA  $\sim 500$  h

"ELSA"

"CLAS"

Transverse Target Polarization  
(race-track coil - Dipole Magnet)

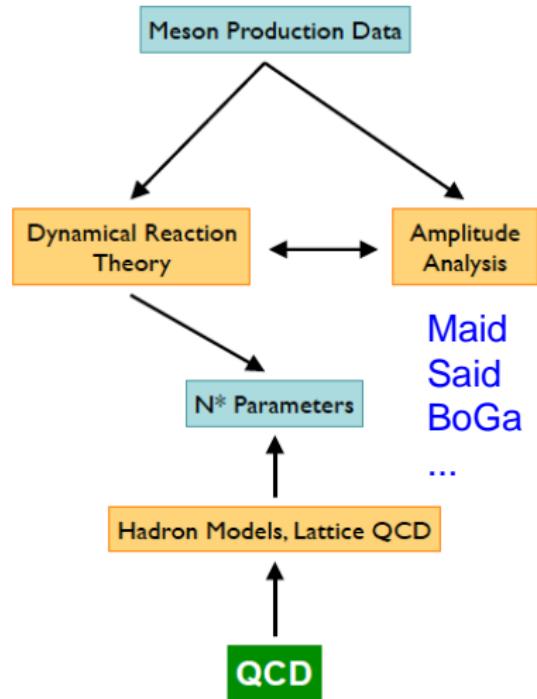

Longitudinally-Polarized Target ( $P_z \approx 80\%$ )

# Extraction of Resonance Parameters

- Double-polarization measurements
- Measurements off neutron and proton to resolve isospin contributions:
  - ➊  $\mathcal{A}(\gamma N \rightarrow \pi, \eta, K)^{I=3/2} \iff \Delta^*$
  - ➋  $\mathcal{A}(\gamma N \rightarrow \pi, \eta, K)^{I=1/2} \iff N^*$
- Re-scattering effects: Large number of measurements (and reaction channels) needed to extract full scattering amplitude.

Coupled Channels

# Why are Polarization Observables Important?

1 From  $\pi$  threshold up to  $\Delta(1232)$  region

- s- & p-wave approximation
- Fermi-Watson Theorem
- Two observables sufficient, e.g.  $d\sigma/d\Omega$ ,  $\Sigma$ .

2 Above the  $\pi\pi$  threshold

- More observables needed.

$$\frac{d\sigma}{d\Omega} = \sigma_0 \{ 1 - \delta_I \Sigma \cos 2\phi + \Lambda_x (-\delta_I H \sin 2\phi + \delta_O F) - \Lambda_y (-T + \delta_I P \cos 2\phi) - \Lambda_z (-\delta_I G \sin 2\phi + \delta_O E) \}$$

Chiang & Tabakin, Phys. Rev. C55, 2054 (1997)

In order to determine the full scattering amplitude without ambiguities, one has to carry out eight carefully selected measurements: four double-spin observables along with four single-spin observables.

Eight well-chosen measurements are needed to fully determine production amplitudes  $F_1$ ,  $F_2$ ,  $F_3$ , and  $F_4$ .

# Baryon Resonances in the Reaction $\gamma p \rightarrow p\omega$

M. Williams et al. [CLAS Collaboration], Phys. Rev. C 80, 065209 (2009)

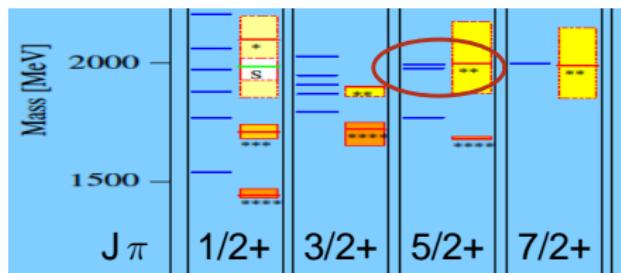

PWA fit includes resonances +  
t-channel amplitudes.

Strong evidence for ( $W > 2$  GeV):

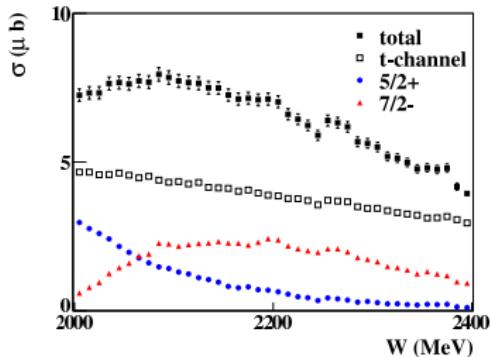

$(5/2)+ N(1680)$  \*\*\*

$(5/2)+ N(1950)$  \*\*

$(7/2)- N(2190)$  \*\*\*

# Polarization Observables in $\gamma p \rightarrow p\omega$

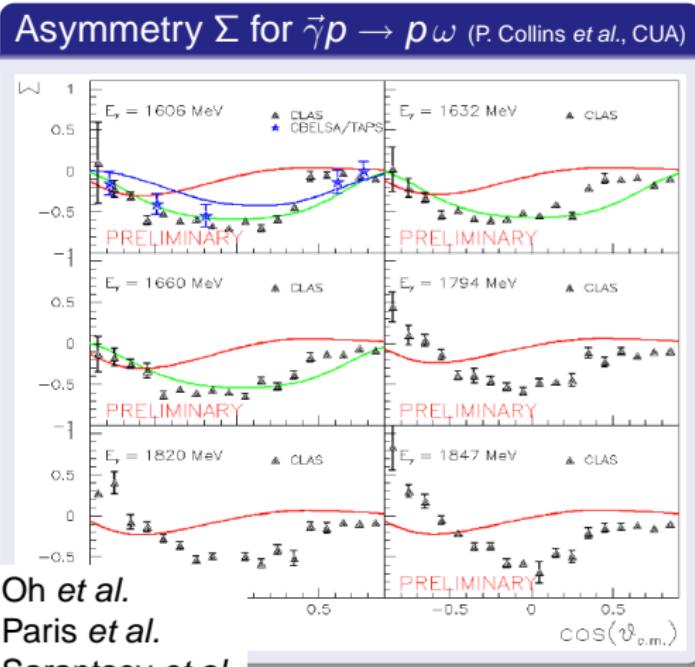

Strong evidence for ( $W > 2$  GeV):

( $5/2^+$ ) N(1680) \*\*\*

( $5/2^+$ ) N(1950) \*\*

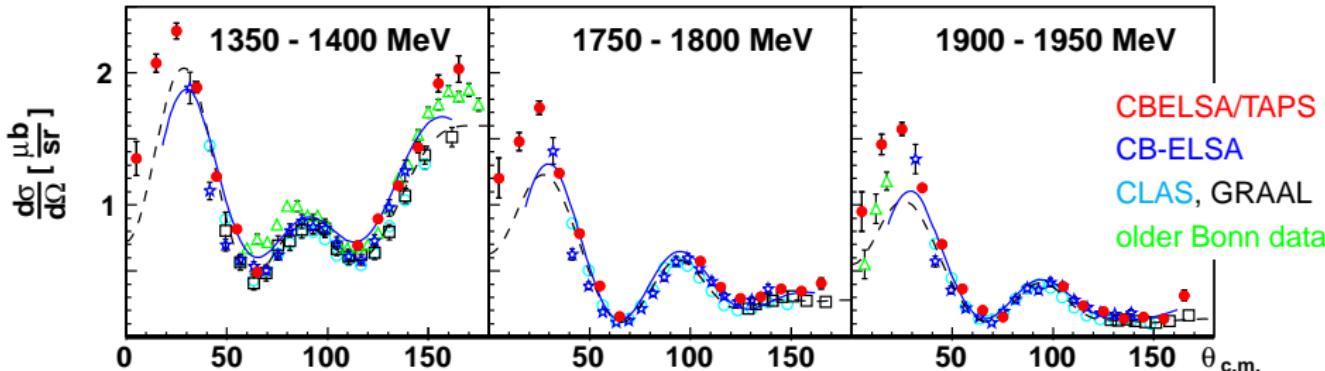

( $7/2^-$ ) N(2190) \*\*\*

# Photoproduction of $\pi^0$ Mesons from the Proton

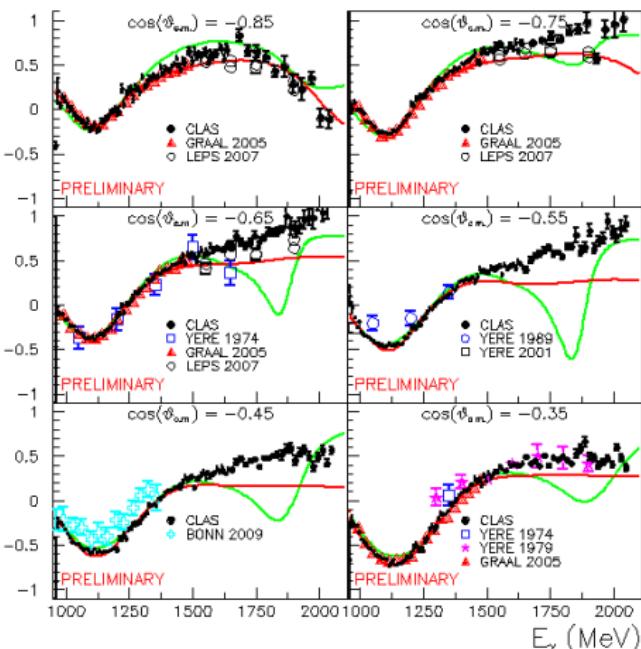

Reaction  $\gamma p \rightarrow p\pi^0$  remains important for our understanding of baryons.

- At ELSA, excellent data with good statistics in the forward direction.
- Forward region is very sensitive to higher-spin resonances:  
 → Observation of  $N(2190)G_{17}$  within the Bonn-Gatchina PWA framework  
 (Important to confirm high-mass states first observed in  $\pi N$  scattering)

# Beam Asymmetry $\Sigma$ in $\vec{\gamma} p \rightarrow p \pi^0$

$\gamma p \rightarrow p \pi^0$

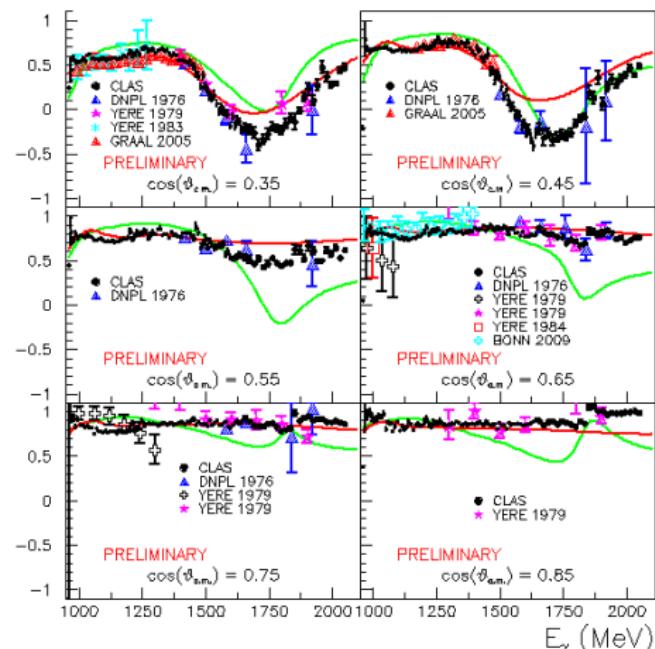

$$\frac{d\sigma}{d\Omega} = \sigma_0 \{ 1 - \delta_I \Sigma \cos 2\phi + \Lambda_x (-\delta_I H \sin 2\phi + \delta_O F) - \Lambda_y (-T + \delta_I P \cos 2\phi) - \Lambda_z (-\delta_I G \sin 2\phi + \delta_O E) \}$$

— SAID — MAID • CLAS  
 $(E_\gamma < 2 \text{ GeV}, -0.85 < \cos \theta_\pi < -0.35)$

→ Serious discrepancies between models and data above 1.4 GeV.

Photoproduction of  $\pi$  mesons still not very well understood.

# Beam Asymmetry $\Sigma$ in $\vec{\gamma} p \rightarrow p \pi^0$

 $\gamma p \rightarrow p \pi^0$ 

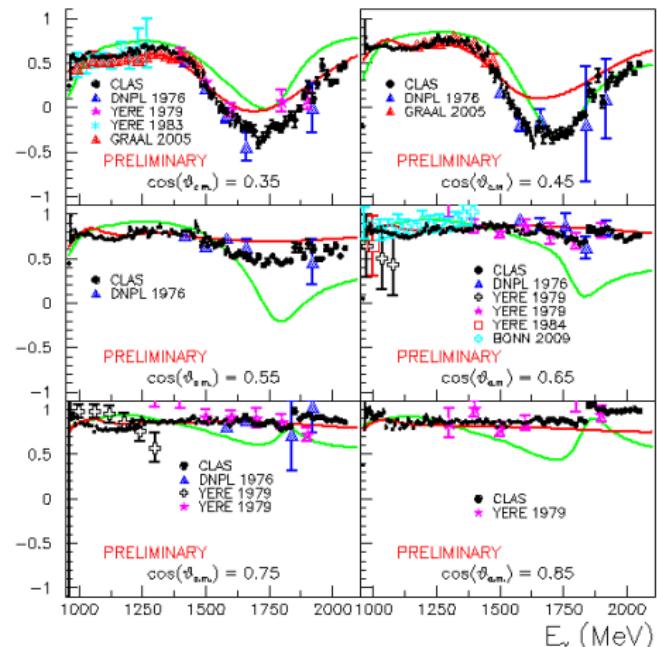

— SAID — MAID • CLAS  
 $(E_\gamma < 2 \text{ GeV}, 0.35 < \cos \theta_\pi < 0.85)$

Combination of  $p\pi^0$  and  $n\pi^+$  final states can help distinguish between  $\Delta$  and  $N^*$  resonances:

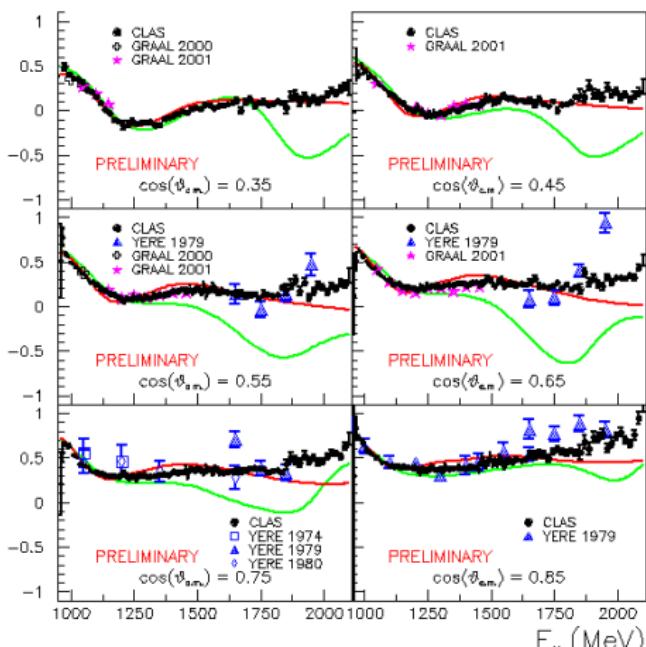

$$\begin{array}{ccc} \Delta^+ & & N^* \\ \downarrow & & \downarrow \\ \pi^0 + p : \sqrt{2/3} |I = \frac{3}{2}, I_3 = \frac{1}{2}\rangle - \sqrt{1/3} |I = \frac{1}{2}, I_3 = \frac{1}{2}\rangle & & \pi^+ + n : \sqrt{1/3} |I = \frac{3}{2}, I_3 = \frac{1}{2}\rangle + \sqrt{2/3} |I = \frac{1}{2}, I_3 = \frac{1}{2}\rangle \end{array}$$

# Beam Asymmetry $\Sigma$ in $\vec{\gamma} p \rightarrow p \pi^0$ and $\vec{\gamma} p \rightarrow n \pi^+$

$\gamma p \rightarrow p \pi^0$

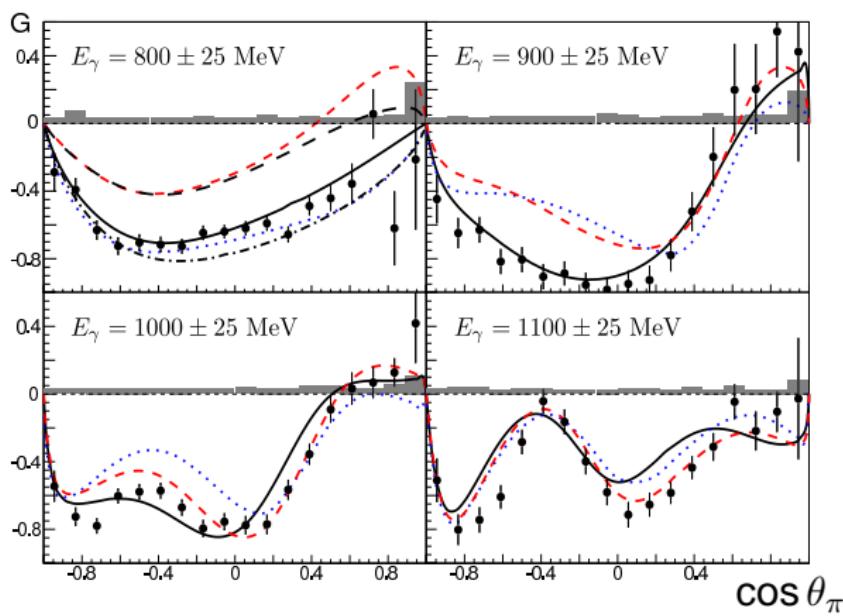

$\gamma p \rightarrow \pi^+ n$

M. Dugger (ASU), CLAS g8b run group, to be published

# Asymmetry $G$ in $\vec{\gamma} \vec{p} \rightarrow p \pi^0$ (Results from ELSA)

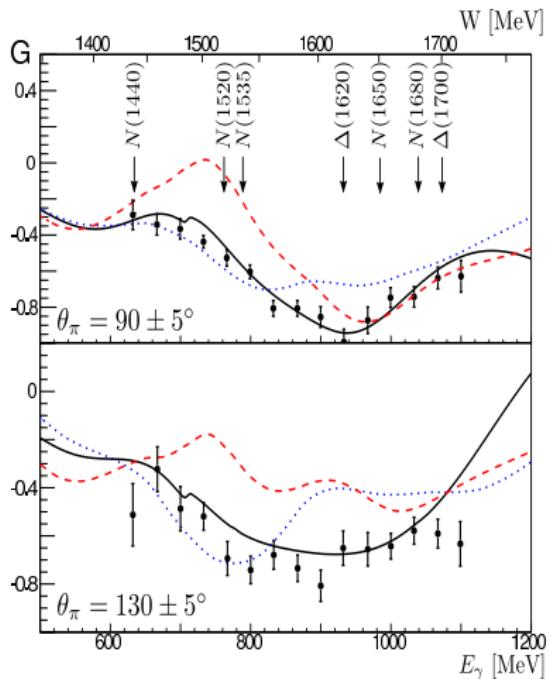

$$\frac{d\sigma}{d\Omega} = \sigma_0 \{ 1 - \delta_I \Sigma \cos 2\phi + \Lambda_x (-\delta_I H \sin 2\phi + \delta_O F) - \Lambda_y (-T + \delta_I P \cos 2\phi) - \Lambda_z (-\delta_I G \sin 2\phi + \delta_O E) \}$$

Surprisingly,  $\pi$  production also not well understood at lower energies:

- BoGa
- SAID
- ... MAID

# Asymmetry $G$ in $\vec{\gamma} \vec{p} \rightarrow p \pi^0$ (Results from ELSA)

$$\frac{d\sigma}{d\Omega} = \sigma_0 \{ 1 - \delta_I \Sigma \cos 2\phi + \Lambda_x (-\delta_I H \sin 2\phi + \delta_O F) - \Lambda_y (-T + \delta_I P \cos 2\phi) - \Lambda_z (-\delta_I G \sin 2\phi + \delta_O E) \}$$

$$\theta_\pi = 90 \pm 5^\circ$$

$$\theta_\pi = 130 \pm 5^\circ$$

Surprisingly,  $\pi$  production also not well understood at lower energies.

Below 1 GeV, discrepancies can be traced to the  $E_{0+}$  and  $E_{2-}$  multipoles, which are related to certain resonances:

$E_{0+}$ :  $N(1535) \frac{1}{2}^-$ ,  $N(1650) \frac{1}{2}^-$ ,  $\Delta(1620) \frac{1}{2}^-$

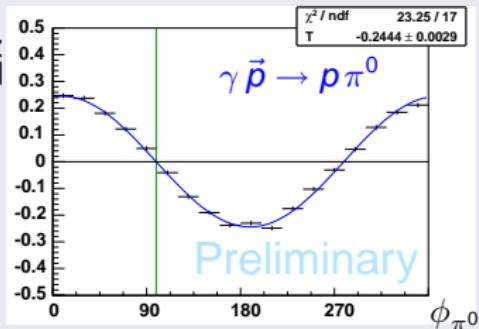

$E_{2-}$ :  $N(1520) \frac{3}{2}^-$ ,  $\Delta(1700) \frac{3}{2}^-$

# Transverse Target Polarization: Target Asymmetry $T$

# $1/S$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $1450 < E_\gamma < 1500$ MeV

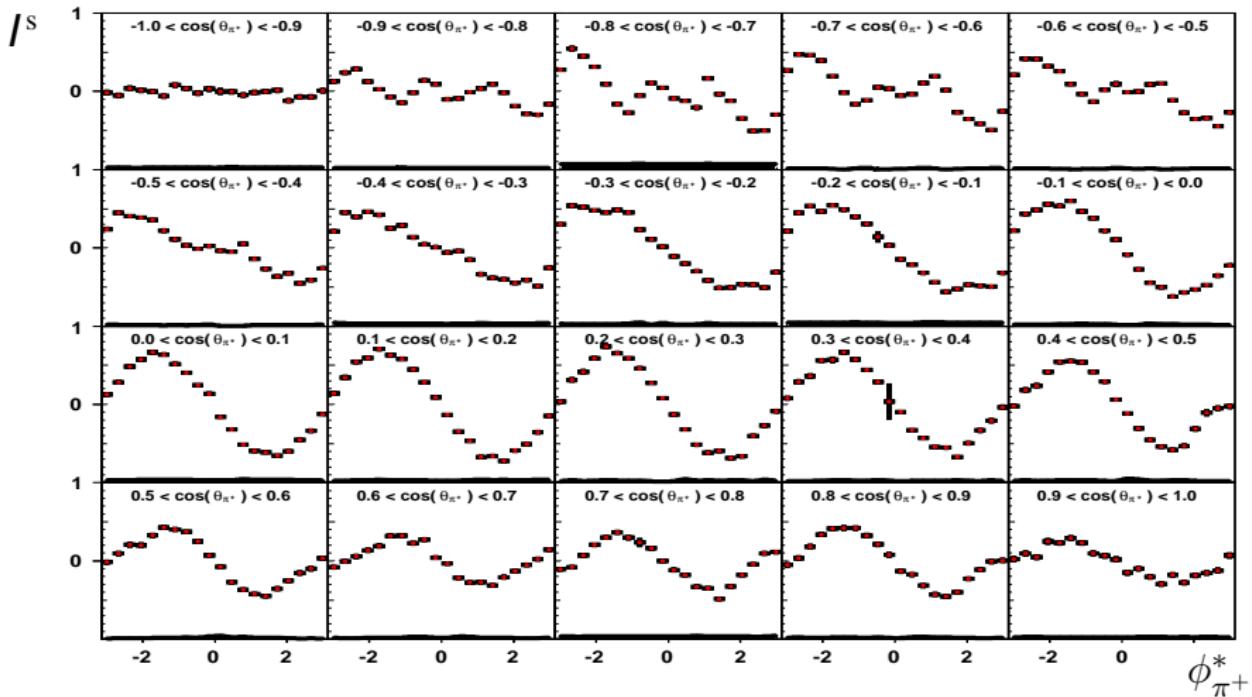

# $1^S$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $1500 < E_\gamma < 1550$ MeV

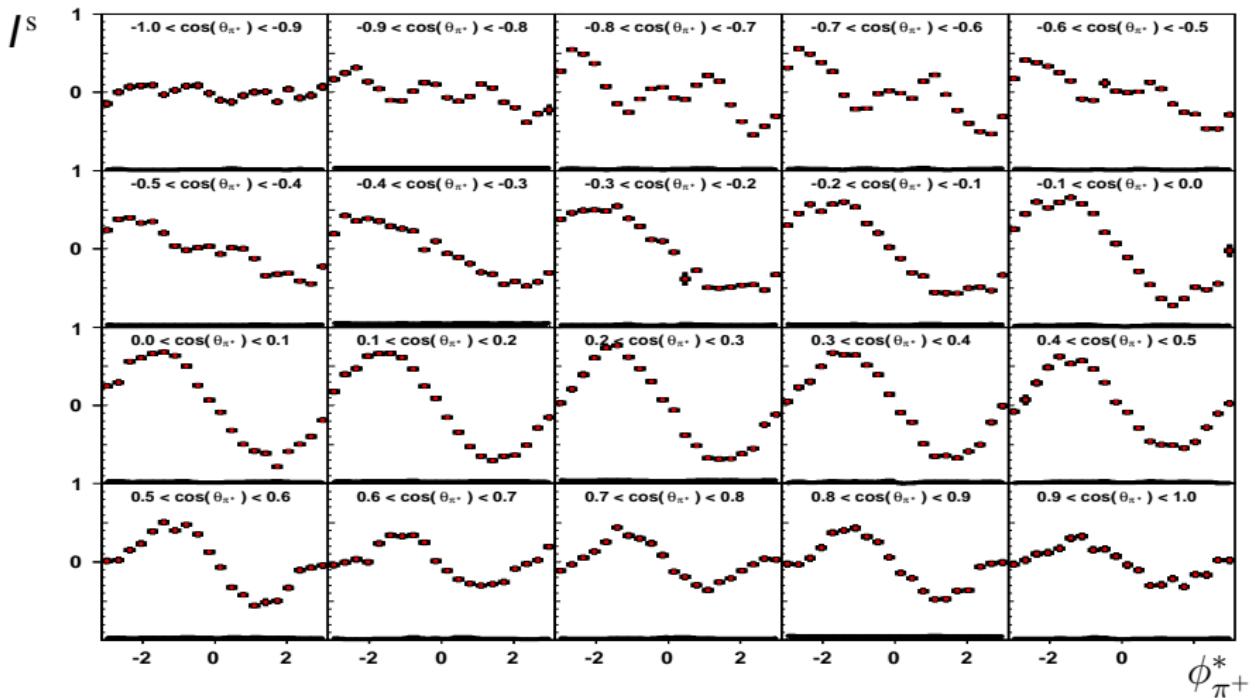

# $1^S$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $1550 < E_\gamma < 1600$ MeV

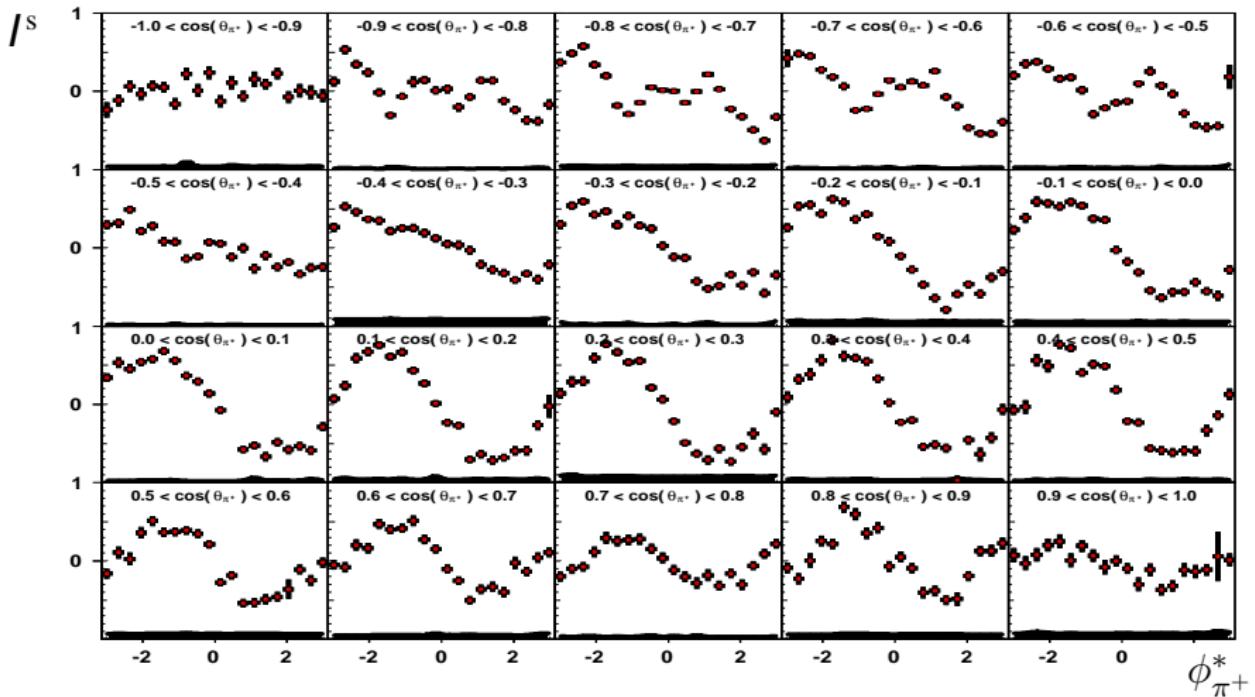

# $1/S$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $1600 < E_\gamma < 1650$ MeV

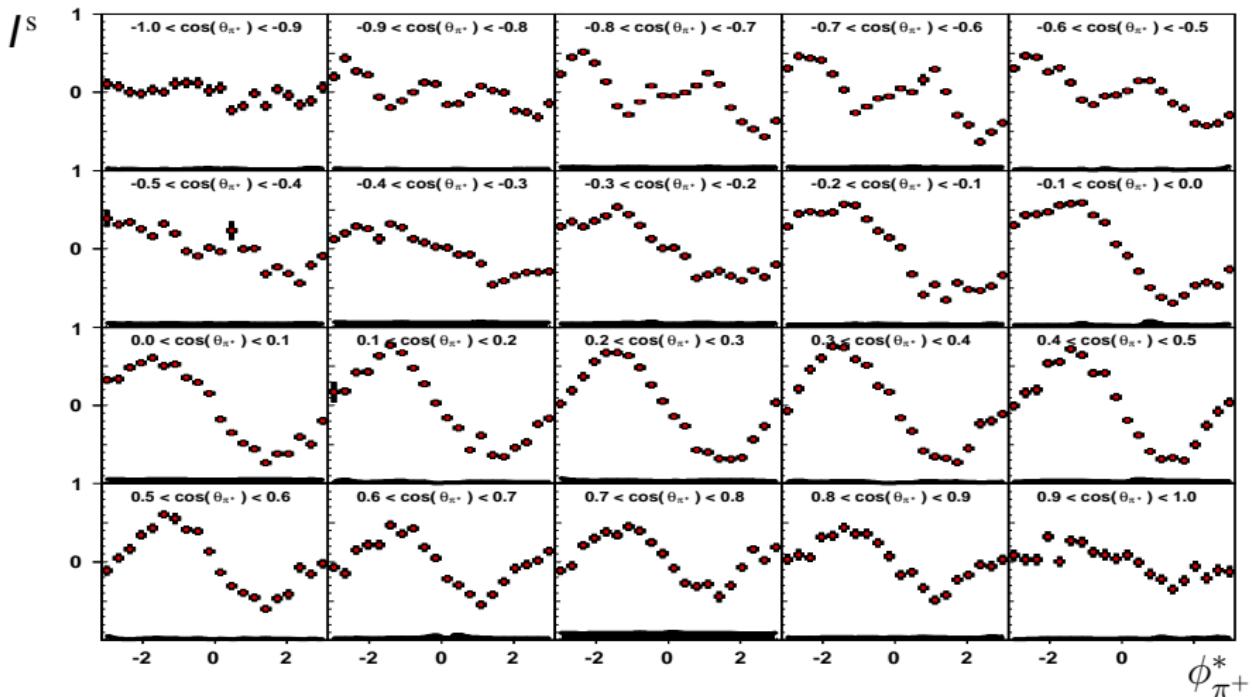

# $1/S$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $1650 < E_\gamma < 1700$ MeV

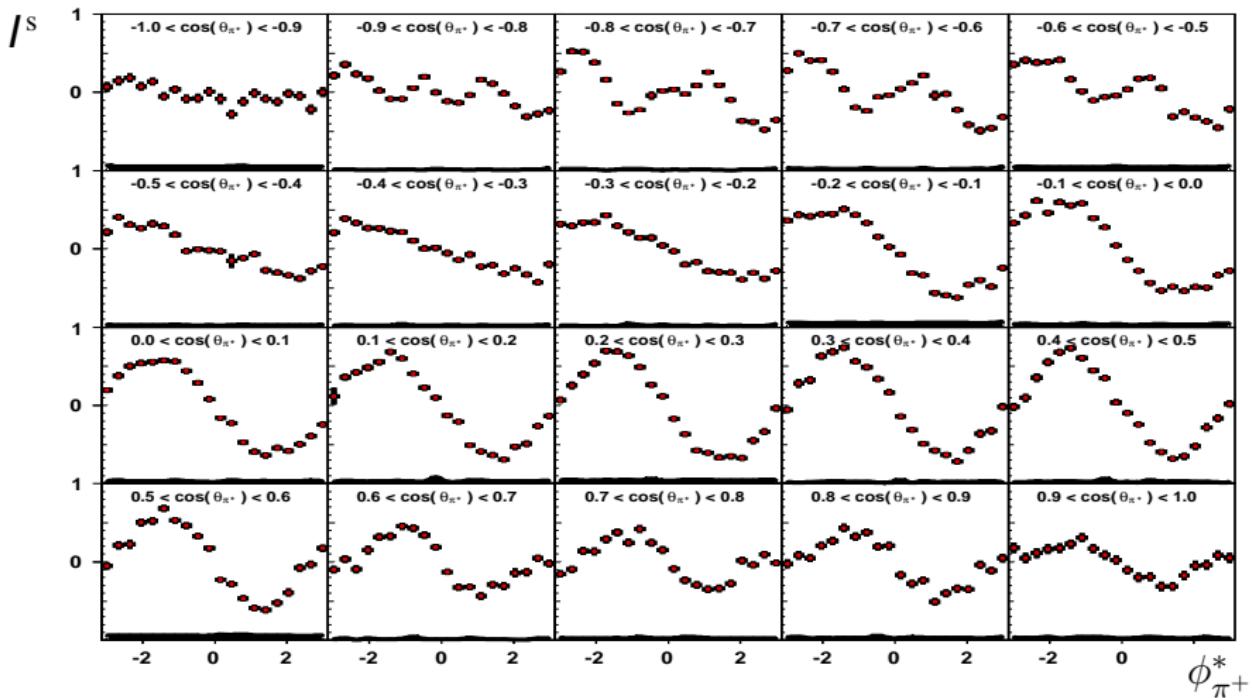

# $J^P$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $1700 < E_\gamma < 1750$ MeV

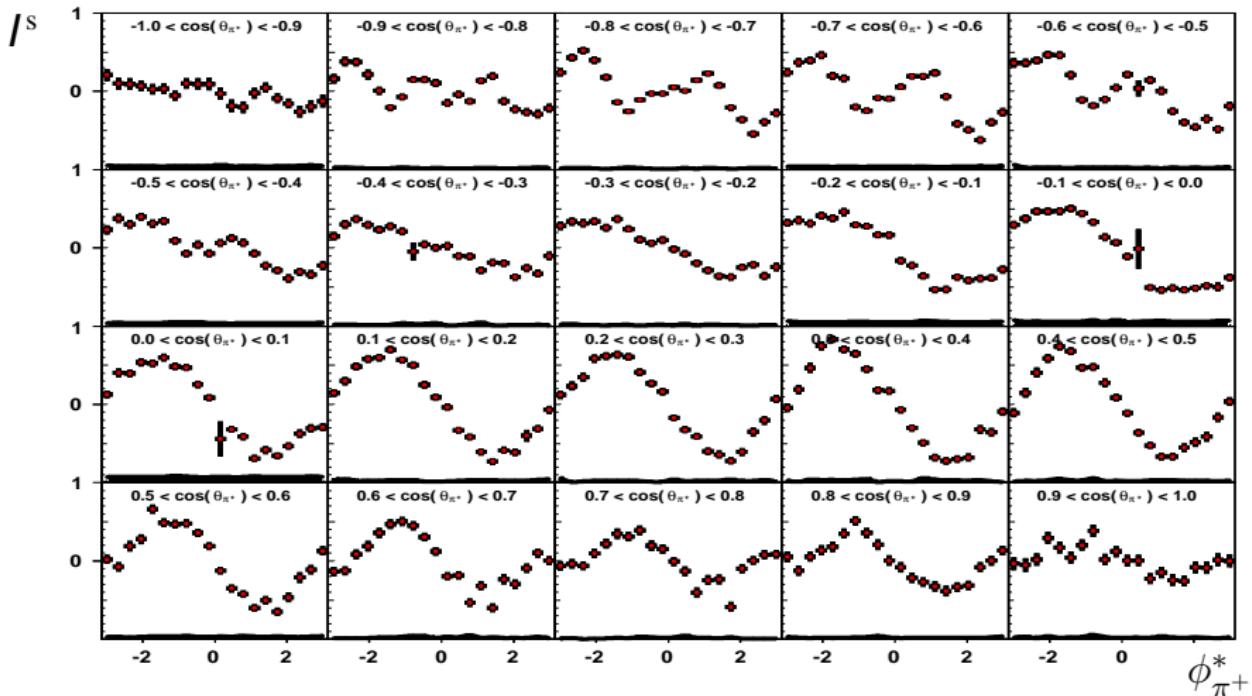

# $1^S$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $1750 < E_\gamma < 1800$ MeV

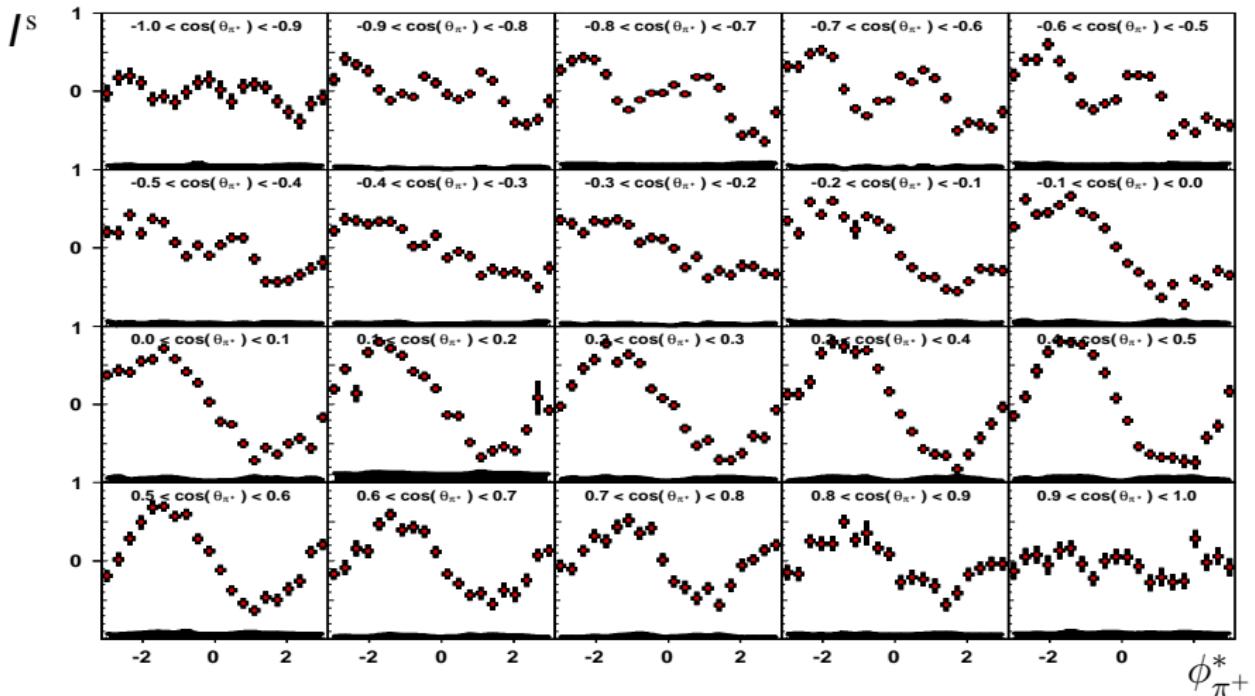

# $1^S$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $1800 < E_\gamma < 1850$ MeV

# $J^P$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $1850 < E_\gamma < 1900$ MeV

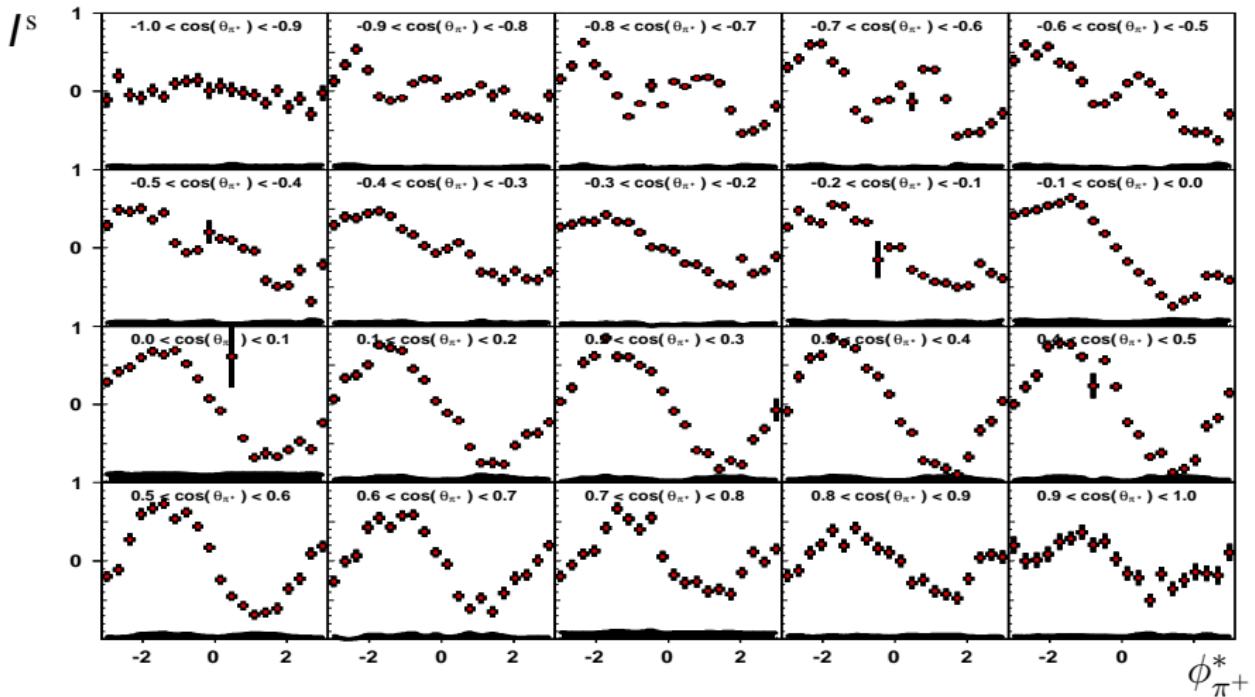

# $1/S$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $1900 < E_\gamma < 1950$ MeV

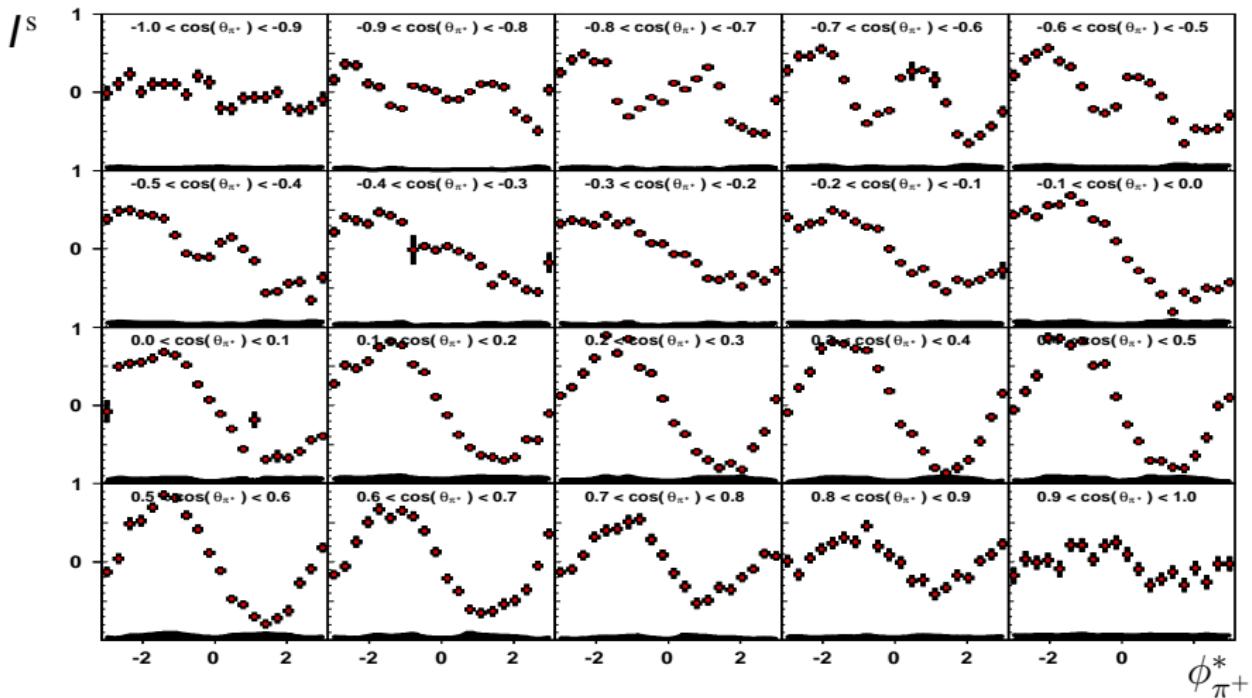

C. Hanretty et al., CLAS-g8b run group, under review

# $J^P$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $1950 < E_\gamma < 2000$ MeV

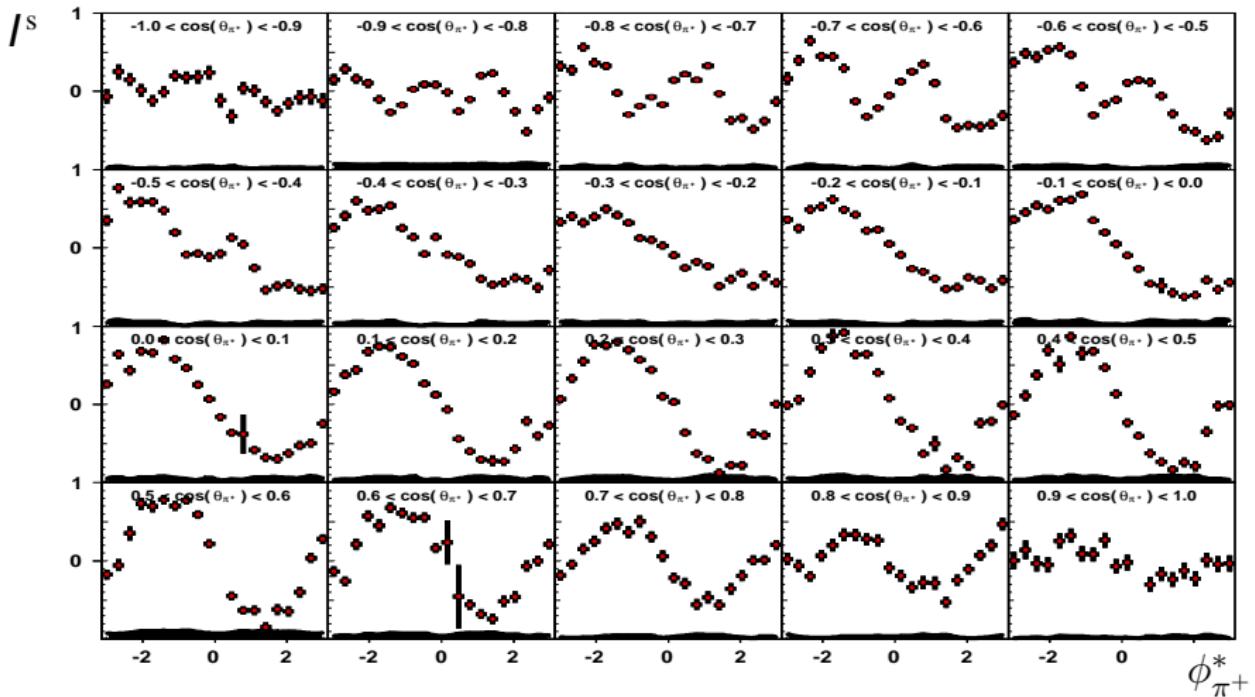

# $J^P$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $2000 < E_\gamma < 2050$ MeV

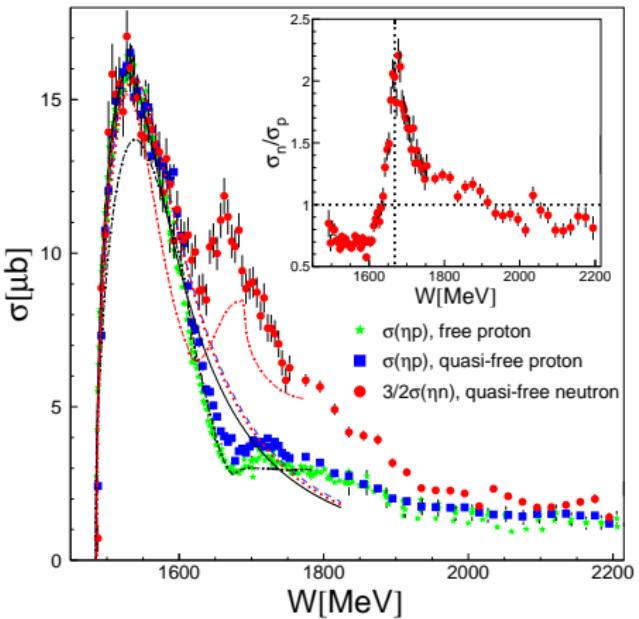

C. Hanretty et al., CLAS-g8b run group, under review

# $1/S$ in $\vec{\gamma} p \rightarrow p \pi^+ \pi^-$ from JLab: $2050 < E_\gamma < 2100$ MeV

C. Hanretty et al., CLAS-g8b run group, under review

# Fascinating Discovery in Reactions off the Neutron

Neutron measurements important:

- Different resonance contributions
- Study of isospin composition of el.-magn. couplings

Narrow structure in  $\gamma d \rightarrow n \eta + p$   
 with  $M \approx 1670$  MeV and  $\sigma = 25$  MeV:

- Interference effect of the  $S_{11}(1535)$  and  $S_{11}(1535)$  resonances
- Coupled channel effect of  $S_{11}(1535)$  and  $P_{11}(1710)$
- New narrow state?
