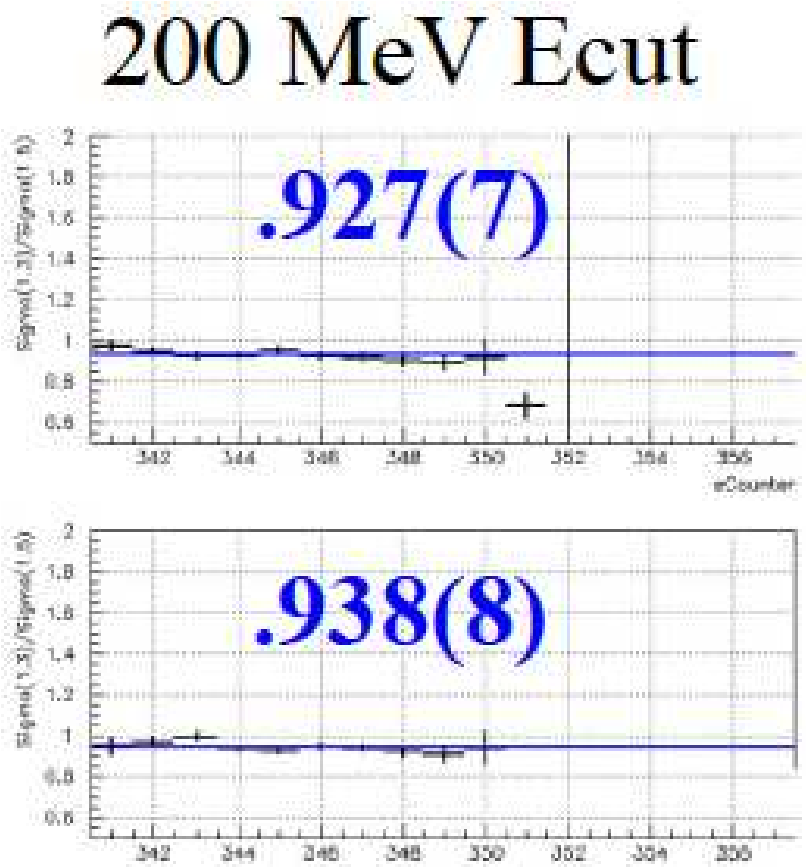
Study of Overlap Regions using $\gamma p \to p\,\pi^+\pi^-$

A word of caution: The $\pi^+\pi^-$ channel has usually good statistics.

➜ Statistics used for the comparisons is cut out in regular analysis.



Consistent with Mike's studies:

- Events with $(\mathrm{Ecut} = 200\ \mathrm{MeV})$

  $E_\gamma < (eventEdge - Ecut)$

  removed from analysis.
- x-axis is *eCounter*.
- I have not studied any other *Ecut* values.
- I have not studied any of the 1700 and 1900 AUTO files.
