

# Physics A - PHY2048C

## Momentum and Collisions

10/14/2019

**My Office Hours:**

Thursday 2:00 - 3:00 PM

212 Keen Building

# Warm-up Questions

- 1 In preparation for today's class, did you read the textbook sections on Impulse and Momentum?
- 2 What is the magnitude of the momentum of a 3000-kg truck traveling at 10 m/s?
- 3 Explain the concept of *impulse* in nonmathematical language.
- 4 Automobiles are designed with “crumple zones” intended to collapse in a collision. Why?

2 Conservation of Momentum

# Energy and Momentum

We found that the total energy of a closed system is conserved.

We introduce now another property called *momentum*:

- The total momentum of a closed system of particles is also conserved.

Energy and Momentum Conservation is one of the most important discoveries in physics.

The momentum of a particle depends on its mass and velocity:

$$\vec{p} = m \vec{v} \quad \text{Units are kg m/s,}$$

where direction of the momentum is the same as the velocity.

# Force and Momentum

Assume the force and acceleration of an object are constant:

$$\vec{F} = m\vec{a} = m \frac{\Delta\vec{v}}{\Delta t} = m \frac{\vec{v}_f - \vec{v}_i}{\Delta t} = \frac{\Delta\vec{p}}{\Delta t}$$

The force can be related to the momentum:

$$\text{Impulse} = \vec{F} \Delta t = \Delta\vec{p}$$

This is called *impulse theorem*. Impulse is a vector quantity:

- Its direction is parallel to the total force.
- The same impulse can be obtained in different ways:
  - 1 A large force acting for a short time.
  - 2 A small force acting for a long time.

# Graphical Analysis of Impulse

Review:  
Momentum  
and Impulse

Conservation  
of Momentum

$$\text{Impulse} = F \Delta t$$

or the area under the  $F - \Delta t$  diagram.

It may be difficult to calculate the form of the force-time curve. Often the time interval is very small.

Example:

Bat hitting a ball:

$$\vec{F}_{\text{ave}} \Delta t = \Delta \vec{p}$$

Conservation  
of Momentum

Impulse and momentum concepts can be applied to collisions:

- The total momentum just before the collision is equal to the total momentum just after the collision.
- The total momentum of the system is conserved.
